

MIRABLOXTECH FRAMEWORK

Solo Tri-Sesh

A workload-based framework for building prototypes solo — with an AI copilot at your side.

LET'S CODE TOMORROW

What is Solo Tri-Sesh?

A method for building a prototype, MVP, or first version of a project **on your own** — using an AI copilot such as Claude Code as your pair-programmer throughout.

- Built for people juggling **multiple tasks** who struggle to prioritize and stay focused on one thing
- The project is split into **3 build sessions**, preceded by a scoping session (Session 0)
- Sessions are defined by **workload**, not the clock or the calendar
- Designed to pair naturally with AI-assisted development, where momentum and context matter

Workload-based, not time-based

Traditional planning slices work into days or weeks. Solo Tri-Sesh slices it into **3 chunks of work** instead — each one ends when its deliverable is done, not when a clock runs out.

✗ Time-based planning

"I'll spend Monday–Wednesday on the backend." Sessions get cut short mid-flow, or padded out doing nothing productive, just to fit the calendar. Context resets every time you stop for the day regardless of where you are.

✓ Solo Tri-Sesh

"Session 1 ends when the pipeline actually produces real predictions." You stop when the deliverable is real and working — whether that took 3 hours or 3 days — keeping full context and momentum until it's genuinely done.

THE STRUCTURE

Session 0, then three builds

Every Solo Tri-Sesh project follows the same shape:

No requirements docs, no sprint boards — just a proposal, then three focused sessions of real building.

The Proposal

Before any code is written, Session 0 exists to think, research, and decide — so the 3 build sessions can run without second-guessing.

- Define the vision and what the tool should (and shouldn't) do
- Research the real options — data sources, tools, hosting, costs
- Lock in the tech stack decisions, with the reasoning behind each one
- Produce a single proposal — no requirements doc, no separate spec, just this

You're reading the output of a Session 0 right now.

The Rules

- **Once a session starts, there's no stopping** until its deliverable is real and working
- **Short breaks are fine** mid-session — step away, come back, keep going
- **Long breaks only happen between sessions** — never in the middle of one

SESSION

BETWEEN

long break allowed here — hours, or days

Why it works

- **Momentum over interruption** — restarting from scratch each day is where solo projects usually die
- **Less decision fatigue** — one deliverable in view at a time, not a whole backlog
- **Real single-tasking** — built for people with too many competing priorities to context-switch well
- **Plays well with AI pairing** — an AI copilot's context stays sharp within a session; long, focused sessions get more out of it than fragmented ones
- **Natural scope control** — a session ends at "it works," not "time's up," which discourages half-finished sprawl

APPLIED TO THIS PROJECT

The Assistant Moneyger

Session	Focus	Deliverable
0 ✓	Research, scope, tech decisions	This proposal
1	Data & Prediction Engine — pipeline, features, xP formula v1	Real predictions.json output
2	Frontend Build — React + TS squad view, XI, transfers	Working local frontend
3	Integration, testing, Vercel deploy	Live public URL, ready for GW1

Cheat Sheet

1. Session 0 = Proposal

Scope, research, decide. No code. Ends with one proposal document.

2. Sessions 1–3 = Build

Each session ships one real, working deliverable.

3. Workload-bound

A session ends when it's done — not when a clock says stop.

4. No stopping mid-session

Short breaks: fine. Long breaks: only between sessions.

5. Built for AI pairing

Designed around working alongside a copilot like Claude Code.

6. Built for scattered focus

One deliverable in view at a time keeps priorities simple.

MiraBloxTech

A mobile-first software studio building mobile apps, web apps, and data science solutions — for East Africa and worldwide.
